

Benzoylecgonine BZE

General:

Benzoylecgonine (ecgonine benzoate) is the primary metabolite of cocaine. It is formed in the liver by the metabolism of cocaine, catalyzed by carboxylesterases, and subsequently excreted in the urine. It can be detected in the urine up to 48 hours after taking cocaine.

Material: 1 ml serum

TAT: 7-10 days*

Method: GCMS

Units: µg/l

Ref.- range: < 50.0
