

Mi 2 autoantibodies

General:

Mi 2 autoantibodies belong to the antibodies against non-histone proteins and are detected in 2-3 % of cases with polymyositis and dermatomyositis. They are not detectable in overlap syndromes and are considered to be relatively specific for the above mentioned disorders.

Indication: Suspicion of polymyositis, dermatomyositis

Material: 1 ml serum

TAT: 5-7 days*

Method: EIA

Units: U/ml

Ref.- range: see report
