

# Zinc Protoporphyrin RBC

## Classification of Porphyria:

<b>Primary Porphyria</b>	
<b>Erythropoietic forms</b>	Inherited erythropoietic porphyria, Morbus Günther: Uroporphyrinogen-III co-synthase deficiency, extremely rare, red coloring of teeth, in early childhood light dermatosis, hemolytic anemia, hepatosplenomegaly and deep red urine;
<b>Hepatic forms</b>	Acute intermittent porphyria (AIP): uroporphyrinogen synthase deficiency, the most frequent (approx. 60% of all porphyrias) and most serious porphyria, more women than men affected (4:1), predominant manifestation age: 20-40 <sup>th</sup> year of life, colic-like abdominal pains, vomiting, crises after drug intake;
<b>Inherited coproporphyria</b>	coproporphyrin oxidase deficiency, very rare, porphyrin in stool increased in latency phases as well;
<b>Porphyria variegata (PV)</b>	protoporphyrinogen oxidase deficiency, rare, manifestation between 10 and 30 years, frequently latent, fecal porphyrin excretion increased;
<b>Porphyria cutanea tarda (PCT)</b>	uroporphyrinogen decarboxylase deficiency, second most frequent porphyria, approx. 35% of all porphyrias, more men than women concerned (3:1), onset usually after 40 years, often after alcohol abuse. Liver function tests are pathological, fecal porphyrins only slightly increased, heptacarboxyporphyrin detectable in stool;
<b>Erythrohepatic forms</b>	Erythrohepatic protoporphyria (EPP): ferrochelatase deficiency, onset at any age, high protoporphyrin excretion in stool, coproporphyrins and uroporphyrins in erythrocytes increased or normal;

<b>Medication induced porphyria</b>	aluminum salts, antiepileptics (carbamazepine, phenytoin, primidone), meprobamate, antirheumatics (gold derivatives, phenacetin, phenylbutazone), danazol, diclofenac, furosemide, griseofulvin, hypnotics and sedatives (esp. barbiturates), local anesthetics, alpha-methyldopa, metopirone, muscle relaxants, anesthetics, spironolactone, sulfonyl urea substances, sulfonamide antibiotics, theophylline, valproic acid, cytostatics;
-------------------------------------	--

<b>Secondary Porphyria</b>	
<b>Intoxications</b>	alcohol, chemicals, heavy metals, (esp. lead: ALS and coproporphyrins in urine, protoporphyrin in urine, stool and in erythrocytes increased);
<b>Liver disorders</b>	cirrhosis, hepatitis, fatty liver, cholestasis, liver changes due to alcohol, porphyrinuria syndrome, hemochromatosis, medication induced damages;
<b>Blood disorders</b>	hemolytic, medication induced, sideroachrestic, sideroplastic and aplastic anemias, malignant anemia, leukemia;
<b>Medication side effects</b>	analgesics, antibiotics, hypnotics, anesthetics, estrogens, sedatives, sulfonyl ureas;
<b>Other causes</b>	diabetes mellitus, neoplasia, iron metabolism disturbances, hepatic cellular bilirubin transport disturbances;

Follow up tests: blood differential, hematocrit, iron, lead, glucose, (postprandial), bilirubin, GOT, GPT,  $\gamma$ -GT.

### Laboratory values in Porphyrias:

	inherited erythropoietic porphyria	acute intermittent porphyria (AIP)	Hereditary coproporphyrinemia	Porphyria variegata (PV)	porphyria cutanea tarda (PCT)	erythrohep. Protoporphyrinemia (EPP)
Inheritance	autosomal recessive	dominant	dominant	dominant	dominant	dominant
Forms	erythropoietic	hepatic	hepatic	hepatic	hepatic	erythrohepatic
Photosensitive skin	yes	no	rare	yes	yes	yes
Abdominal pain attacks	no	yes	yes	yes	no	no

<b>Urine</b>						
δ-ALA	n	(+++)	(+++)	(+++)		n
PBG	n	(+++)	(+++)	(+++)	n	n
URO	+++	++	+	+	+++	n
COPRO	++	n	+++	++	+	(+/+++)
<b>Stool</b>						
COPRO	+	n	+++	+	(+)	(+)
PROTO	+	n	+	+++	n	+++
<b>Erythrocytes</b>						
COPRO	+++	n	n	n	n	+
URO	++	n	n	n	n	n

PROTO	(+)	n	n	n	n	+++
-------	-----	---	---	---	---	-----

N = normal

() = often increased only during a crisis

+ = slightly increased

++ = moderately increased

+++ = significantly increased

ALA = alpha-ALA, delta aminolevulinic acid

PBG = Porphobilinogen

PROTO = Protoporphyrin

URO = Uroporphyrin

COPRO = Coproporphyrin

General:

Examinations if suspecting porphyria:

*Urine:* δ-aminolevulinic acid, porphobilinogen (PBG) and complete porphyrins. PV (also in latency phase), hereditary coproporphyria, AIP are detected.

*Stool:* Porphyrins. EPP, latency phases of PV and hereditary coproporphyria are included.

*Examinations in diagnosed porphyria:* Porphyrins complete in urine, porphyrins differentiated in urine, δ-aminolevulinic acid in urine, porphobilinogen in urine, porphyrins erythrocytic, zinc protoporphyrin erythrocytic, coporphyrin in stool and protoporphyrin in stool.

The following tests are available:

• **Porphyrians, total, in urine**

Indication: Acute intermittent porphyria (AIP), hereditary erythropoietic porphyria (Morbus Guenther), erythro-hepatic protoporphyrinemia (EPP), porphyria variegata (PV). Porphyria cutanea tarda (PCT), hereditary coproporphyria, para-neoplastic porphyria (in prostate gland and liver tumors), acute and chronic lead poisoning induced porphyria (e.g. hexachlorbenzene, polychlorinated biphenyls, vinylchlorid, TCDD)

Material: 10 (20) ml urine

Preanalytics: 24 hour urine, collect light protected, no spontaneous urine, please indicate urine quantity

TAT: 7-10 days\*

Method: RECH

Units:  $\mu\text{g}/24\text{h}$

Ref.- range: up to 150

• **Porphyryns, total, in stool**

Material: 5 g stool

TAT: 7-10 days\*

Units:  $\mu\text{g}/\text{g}$  stool

Ref.- range: up to 34.0

• **Porphyryns, total, in RBC**

Material: 3 ml EDTA blood

TAT: 7-10 days\*

Method: HPLC

Units:  $\mu\text{g}/\text{dl}$  Ery.

Ref.- range: up to 60.0

• **Porphyryns, differentiated in urine**

Indication: Acute intermittent porphyria (AIP), hereditary erythropoietic porphyria (Morbus Guenther), erythro-hepatic protoporphyria (EPP), porphyria variegata (PV). Porphyria cutanea tarda (PCT), differentiation of positive total porphyryns, e.g. heptacarboxy-, hexacarboxy-, pentacarboxy porphyryns.

Material: 20 ml urine

Preanalytics: 24 hour urine cool, light protected and collected without additives, no spontaneous urine!

TAT: 7-10 days\*

Method: HPLC

Units:  $\mu\text{g}/24\text{h}$

- **Delta-aminolevulinic acid,  $\delta$ -ALA, in urine**

General: Delta-aminolevulinic acid (5-aminolevulinic acid,  $\delta$ -ALA) is an intermediate product in porphyrin biosynthesis.  $\delta$ -ALA is generated from succinyl-coenzyme A, glycine and pyridoxal phosphate. Porphobilinogen is formed by condensation of two molecules ALA and catalyzed by the enzyme PBG-synthetase.

Indication: Suspicion of porphyria, lead intoxication

Material: 24 h collection period urine

Preanalytics: 24-hour urine with 10 ml of 10% acetic acid, of which 10 ml should be sent indicating the collected quantity.

TAT: 7-10 days\*

Method: RECH

Units: mg/24h

Ref.- range: <5.0

Note: The combined determination of porphobilinogen, porphyrine and  $\delta$ -ALA is recommended

- **Porphobilinogen, PBG, in urine**

Material: 20 ml urine

Preanalytics: 24 hour urine, cool and light protected and collected without additives, no spontaneous urine!

TAT: 7-10 days\*

Method: RECH

Units: mg/24h

Ref.- range: up to 3.0

Note: Porphobilinogen should always be requested together with  $\delta$ -ALA

- **Uroporphyrin, coproporphyrin, pentaporphyrin, hexaporphyrin, heptaporphyrin in urine**

Material: 10 ml urine

TAT: 7-10 days\*

- **Uroporphyrin, protoporphyrin, coproporphyrin, pentaporphyrin, hexaporphyrin, heptaporphyrin in stool**

Material: 5 g stool

TAT: 7-10 days\*

- **Zinc protoporphyrin, in RBC**

Material: 3 ml EDTA blood

TAT: 7-10 days\*

Method: HPLC

Units:  $\mu\text{g/g Hb}$

Ref.- range: 0.70 - 4.00
